### 3 Introduction

The following document details the Module Interface Specifications for Stoichiometry Mass-Mass Program

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found [here](#)

### 4 Notation

The structure of the MIS for modules comes from ?, with the addition that template modules have been adapted from ?. The mathematical notation comes from Chapter 3 of ?. For instance, the symbol  $:=$  is used for a multiple assignment statement and conditional rules follow the form  $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$ .

The following table summarizes the primitive data types used by SMMP.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	$\mathbb{Z}$	a number without a fractional component in $(-\infty, \infty)$
natural number	$\mathbb{N}$	a number without a fractional component in $[1, \infty)$
real	$\mathbb{R}$	any number in $(-\infty, \infty)$

The specification of SMMP uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, SMMP uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification. Since chemical reaction is central to SMMP, the following notation is introduced in an attempt to simplify the presentation of the MIS.

Chemical reaction:

$$c_1 R[0]_1 + c_2 R[0]_2 = cc_1 R[1]_1 + cc_2 R[1]_2$$

where  $R[0]_1$  is reactant with known mass,  $c_1$  is the coefficient number associated to this reactant,  $R[0]_2$  is reactant with unknown mass,  $c_2$  is the coefficient number associated to this reactant,  $R[1]_i$  is a product and  $cc_i$  is the coefficient number associated to this product.

## 5 Module Decomposition
